 $\label{lem:abstract} \textbf{Abstract} \textbf{—} \textbf{This manual provides solutions for random numbers assignment.}$ 

#### 1 Uniform Random Numbers

Let U be a uniform random variable between 0 and 1.

1.1 Generate  $10^6$  samples of U using a C program and save into a file called uni.dat .

Solution: Download the following files.

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q1/uniform.c wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q1/coeffs.h

Then use the following commands in linux terminal,

cc uniform.c –lm

1.2 Load the uni.dat file into python and plot the empirical CDF of *U* using the samples in uni.dat. The CDF is defined as

$$F_U(x) = \Pr\left(U \le x\right) \tag{1.1}$$

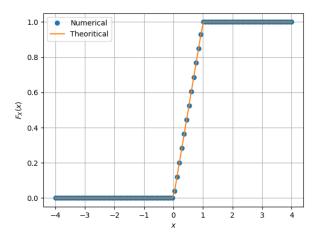

Fig. 1.1: The CDF of U

**Solution:** Use the following code to plot Fig. 1.1

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q1/ uniform cdf plot.py

Run the following command in the linux terminal,

python3 uniform\_cdf\_plot.py

1.3 Find a theoretical expression for  $F_U(x)$ .

**Solution:** Given that, random variable U is uniformly distributed in interval (0,1). So we can write that, the probability density function

$$f_U(x) = \frac{1}{1 - 0}$$
 (1.2)  
= 1 (1.3)

So for  $x \in (0,1)$ , the probability distribution

function  $F_U(x)$  can be calculated as,

$$F_U(x) = \int_0^x f_x(x) \, dx \tag{1.4}$$

$$= \int_0^x 1dx \tag{1.5}$$

$$=x\tag{1.6}$$

For x < 0,

$$F_U(x) = \Pr(U \le x) = 0 \ (\because f_U(x) = 0) \ (1.7)$$

And for x > 1

$$F_U(x) = \Pr(U \le x) = 1 \ (\because f_U(x) = 0) \ (1.8)$$

Overall,

$$F_U(x) = \begin{cases} 0 & , x \le 0 \\ x & , 0 < x < 1 \\ 1 & , x \ge 1 \end{cases}$$

1.4 The mean of U is defined as

$$E[U] = \frac{1}{N} \sum_{i=1}^{N} U_i$$
 (1.9)

and its variance as

$$\text{var}[U] = E[U - E[U]]^2$$
 (1.10)

Write a C program to find the mean and variance of U.

**Solution:** Download the following code,

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/O1/ mean var uniform.c

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q1/coeffs.h

Run the following command,

We will get output as,

$$mean = 0.500007$$
 (1.11)

$$variance = 0.083301$$
 (1.12)

1.5 Verify your result theoretically given that

$$E\left[U^{k}\right] = \int_{0}^{\infty} x^{k} dF_{U}(x) \tag{1.13}$$

**Solution:** Already we know that,

$$F_{U}(x) = \begin{cases} 0 &, x \le 0 \\ x &, 0 < x < 1 \\ 1 &, x \ge 1 \end{cases}$$

So, the given integral solves down to,

$$E\left[U^{k}\right] = \int_{0}^{1} x^{k} dx \tag{1.14}$$

Since  $F_U(x)$  is constant w.r.t x for  $x \ge 1$  amd  $x \le 0$ . For mean.

$$E[U] = \int_0^1 x dx \tag{1.15}$$

$$= \left\{ \frac{x^2}{2} \right\}_0^1 \tag{1.16}$$

$$= 0.5$$
 (1.17)

(1.9) Now for variance, we know that

$$Var[U] = E[U - E[U]]^{2}$$
 (1.18)

$$= E \left[ U^2 + E \left[ U \right]^2 - 2E \left[ U \right] U \right] \quad (1.19)$$

(1.20)

Since expected value is a linear operator, we can write

$$= E[U^{2}] + E[U]^{2} - 2E[U]^{2}$$
 (1.21)

$$=E\left[U^{2}\right]-E\left[U\right]^{2}\tag{1.22}$$

To get variance we will find,

$$E[U^2] = \int_0^1 x^2 dx$$
 (1.23)

$$= \left\{ x^3 / 3 \right\}_0^1 \tag{1.24}$$

$$= \left\{ x^3 / 3 \right\}_0^1$$
 (1.24)  
=  $\frac{1}{3}$  (1.25)

Therefore,

$$Var[U] = \frac{1}{3} - \left(\frac{1}{2}\right)^2$$
 (1.26)

$$=\frac{1}{3}-\frac{1}{4}\tag{1.27}$$

$$=\frac{1}{12}$$
 (1.28)

$$= 0.0833$$
 (1.29)

### 2 Central Limit Theorem

2.1 Generate 10<sup>6</sup> samples of the random variable

$$X = \sum_{i=1}^{12} U_i - 6 \tag{2.1}$$

using a C program, where  $U_i$ , i = 1, 2, ..., 12 are a set of independent uniform random variables between 0 and 1 and save in a file called gau.dat.

**Solution:** Download the code below

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/gaussian.c wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/coeffs.h

# Run the following command

cc gaussian.c ./a.out

2.2 Load gau.dat in python and plot the empirical CDF of *X* using the samples in gau.dat. What properties does a CDF have?

**Solution:** Download the below code,

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/ gaussian\_cdf\_plot.py

Run the following command to get CDF plot,

The CDF of X is plotted in Fig. 2.1.

# **Properties Of CDF:**

- CDF is monotonically increasing from  $-\infty < x < \infty$
- Let us define the Q(x) function as, Q(x) = Pr(X > x)
- The CDF, $F_X(x) = 1 Q(x) = Q(-x)$
- 2.3 Load gau.dat in python and plot the empirical PDF of *X* using the samples in gau.dat. The PDF of *X* is defined as

$$p_X(x) = \frac{d}{dx} F_X(x) \tag{2.2}$$

What properties does the PDF have?

**Solution:** The PDF of X is plotted in Fig. 2.2 using the code below

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/ gaussian pdf plot.py

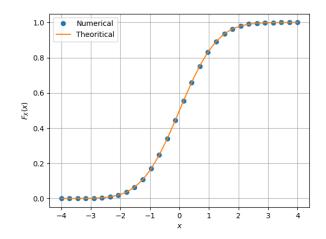

Fig. 2.1: The CDF of X

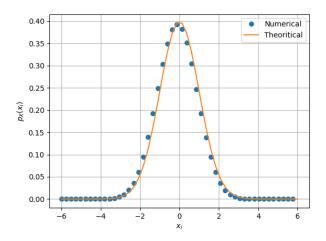

Fig. 2.2: The PDF of X

Run the following command,

python3 gaussian\_pdf\_plot.py

# **Properties of PDF:**

- a)  $\forall x \in \mathbb{R}, \ p_X(x) \ge 0$
- b) PDF is symmetric about the mean, in this case at x = 0
- c) The maxima of the curve is observed at mean of distribution.
- 2.4 Find the mean and variance of *X* by writing a C program.

**Solution:** Download the C code from the links below,

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/ mean var gauss.c wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q2/coeffs.h

Then run the following command in linux terminal

we will get *mean* = 0.000326, *variance* = 1.000906

#### 2.5 Given that

$$p_X(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right), -\infty < x < \infty, \quad (2.3)$$

repeat the above exercise theoretically.

Solution: Given that,

$$p_X(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right), -\infty < x < \infty, \quad (2.4)$$

We know,

$$E[x] = \int_{-\infty}^{\infty} x p_X[x] dx \qquad (2.5)$$

$$= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} x \exp\left(-\frac{x^2}{2}\right) dx \qquad (2.6)$$

Since  $\frac{1}{\sqrt{2\pi}}x \exp\left(-\frac{x^2}{2}\right)$  is an odd function. We can write,

$$E[x] = 0 \tag{2.7}$$

Consider the following expression,

$$E\left[x^{2}\right] = \int_{-\infty}^{\infty} x^{2} p_{X}[x] dx \qquad (2.8)$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} x^2 e^{\left(-\frac{x^2}{2}\right)} dx \qquad (2.9)$$

To solve the above integral, we will use integration by parts, i.e,

$$\int uvdx = u \int vdx - \int u' \left( \int vdx \right) dx \tag{2.10}$$

$$E\left[x^{2}\right] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} x \left(xe^{-\frac{x^{2}}{2}}\right) dx \qquad (2.11)$$
$$= \frac{1}{\sqrt{2\pi}} \left(x \int xe^{-\frac{x^{2}}{2}} dx - \int \left(\int xe^{-\frac{x^{2}}{2}} dx\right)\right) \qquad (2.12)$$

For the integral  $\int x \exp\left(-\frac{x^2}{2}\right) dx$  let us take,

$$t = \frac{x^2}{2} \tag{2.13}$$

$$dt = xdx (2.14)$$

$$\int x \exp\left(-\frac{x^2}{2}\right) dx = \int \exp\left(-t\right) dt \qquad (2.15)$$

$$= -\exp(-t) + c$$
 (2.16)

$$\implies = -\exp\left(-\frac{x^2}{2}\right) + c \quad (2.17)$$

Using (2.17), we can write

$$E\left[x^{2}\right] = \frac{1}{\sqrt{2\pi}} \left(-xe^{-\frac{x^{2}}{2}} + \int e^{\frac{-x^{2}}{2}} dx\right) \quad (2.18)$$

And we know that,

$$\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{\frac{-x^2}{2}} = 1 \tag{2.19}$$

Now putting limits and using (2.7),(2.19),

$$E\left[x^2\right] = 1\tag{2.20}$$

Using (1.22) we can write,

$$Var[x] = 1 - 0$$
 (2.21)

$$= 1 \tag{2.22}$$

#### 3 From Uniform to Other

#### 3.1 Generate samples of

$$V = -2\ln(1 - U) \tag{3.1}$$

and plot its CDF.

**Solution:** Download the C code from the link below to generate samples of V from uni.dat file

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q3/V.c

Run the following command,

Then download the below python file to get CDF

wget https://github.com/Charanyash/Random-Numbers-/blob/main/codes/Q3/ V\_cdf\_plot.py

Then run the following command

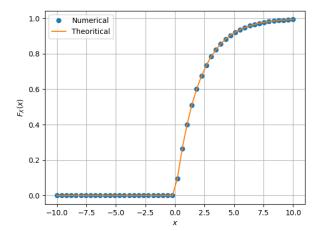

Fig. 3.1: The CDF of V

python3 V cdf plot.py

# 3.2 Find a theoretical expression for $F_V(x)$ .

**Solution:** Given

$$V = -2\ln(1 - U) \tag{3.2}$$

$$F_V(x) = \Pr(V \le x) \tag{3.3}$$

we will use (3.3)

$$F_V(x) = \Pr(-2\ln(1 - U) \le x)$$
 (3.4)

$$=\Pr\left(\ln\left(1-U\right) \ge \frac{-x}{2}\right) \tag{3.5}$$

$$= \Pr\left(1 - U \ge \exp\left(\frac{-x}{2}\right)\right) \tag{3.6}$$

$$= \Pr\left(U \le 1 - \exp\left(\frac{-x}{2}\right)\right) \tag{3.7}$$

$$=F_U\left(1-\exp\left(\frac{-x}{2}\right)\right) \tag{3.8}$$

For x > 0,  $1 - e^{\frac{-x}{2}} < 1$  and x < 0,  $1 - e^{\frac{-x}{2}} < 0$ 

$$F_V(x) = \begin{cases} 0 & x \le 0\\ 1 - \exp\left(\frac{-x}{2}\right) & x > 0 \end{cases}$$
 (3.9)

### 4 Triangular Distribution

#### 4.1 Generate

$$T = U_1 + U_2 \tag{4.1}$$

**Solution:** Download the below code.

wget https://github.com/Charanyash/ Random-Numbers-/blob/main/codes/ Q4/coeffs.h

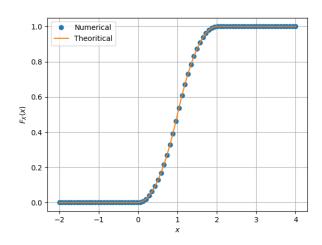

Fig. 4.1: The CDF of T

wget https://github.com/Charanyash/ Random-Numbers-/blob/main/codes/ Q4/triangular.c

and run the following command,

cc triangular.c –lm ./a.out

You will get required generated random numbers in tri.dat file.

4.2 Find the CDF of T.

**Solution:** Download the below files,

wget https://github.com/Charanyash/ Random-Numbers-/blob/main/ codes/Q4/tri.dat wget https://github.com/Charanyash/ Random-Numbers-/blob/main/ codes/Q4/tri\_cdf\_plot.py

Run the following command,

python3 tri\_cdf\_plot.py

4.3 Find the PDF of *T*.

Solution: Download the below files,

wget https://github.com/Charanyash/ Random-Numbers-/blob/main/ codes/Q4/tri.dat wget https://github.com/Charanyash/ Random-Numbers-/blob/main/

codes/Q4/tri pdf plot.py

Run the following command,

python3 tri pdf plot.py

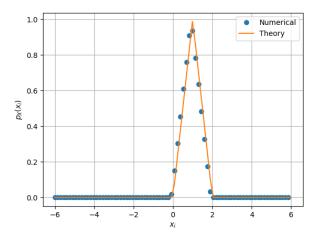

Fig. 4.2: The PDF of T

4.4 Find the theoretical expressions for the PDF and CDF of *T*.

**Solution:** Given that.

$$T = U1 + U2 \tag{4.2}$$

where U1, U2 are uniform random variables  $\in (0, 1)$ .

The CDF of T is defined as,

$$F_T(t) = \Pr(T \le t) \tag{4.3}$$

Now from (4.2) we can write,

$$F_T(t) = \Pr(U1 + U2 \le t)$$
 (4.4)

**Case -1 :** For t > 2.

The Pr  $(U1 + U2 \le t) = 1$ , because for every U1 = u1 and U2 = u2, u1 + u2 < 2,

$$\implies F_T(t) = 1$$
 (4.5)

**Case -2 :** For t < 0.

The Pr  $(U1 + U2 \le t) = 0$  because for every U1 = u1 and U2 = u2, u1 + u2 > 0,

$$\implies F_T(t) = 0$$
 (4.6)

**Case - 3:** For,  $t \in (0, 2)$ .

We cannot eliminate the inequality like we did before, so in this case we will operate the inequality by fixing U1 = x where  $x \in (0, t)$ .

So in this case CDF will be,

$$F_T(t) = \Pr(U1 + U2 \le t)$$
 (4.7)

$$= \Pr(U1 = x, U2 \le t - x) \tag{4.8}$$

$$= \Pr(U1 = x) \Pr(U2 \le t - x)$$
 (4.9)

Since U1,U2 are i.i.d.

Now note that x is a variable and varies in (0, t), so we have to take integral over x to evaluate the Pr(U1 = x),

$$F_T(t) = \int_0^t f_U(x) \Pr(U2 \le t - x) dx$$
(4.10)

$$= \int_0^t f_U(x) F_U(t-x) dx \qquad (4.11)$$

**Case - 1** For  $t \in (0, 1)$ , we know  $f_U(x) = 1$  so,

$$F_T(t) = \int_0^t 1.F_U(t - x) dx$$
 (4.12)

As, x < t, 0 < t - x < t < 1 using (1), we can write

$$F_T(t) = \int_0^t (t - x) \, dx \tag{4.13}$$

$$= \left\{ tx - \frac{x^2}{2} \right\}_0^t \tag{4.14}$$

$$=\frac{t^2}{2}$$
 (4.15)

Case -2 For  $t \in (1, 2)$ , we know  $f_U(x) = 0$  at x > 1, so the integral solves down to,

$$F_T(t) = \int_0^1 f_U(x) F_U(t - x) dx \qquad (4.16)$$

$$= \int_{0}^{1} 1.F_{U}(t-x) dx \tag{4.17}$$

(4.18)

To solve the above integral we will use integration by substitution,

$$k = t - x \tag{4.19}$$

$$dk = -dx (4.20)$$

$$F_T(t) = \int_t^{t-1} F_U(k) (-dk)$$
 (4.21)

$$= \int_{t-1}^{t} F_{U}(k) dk$$
 (4.22)

As  $1 \le t \le 2, 0 \le t - 1 \le 1$  we will

break integral at 1 because  $F_U(k)$  changes at 1.Using (1),

$$F_{T}(t) = \int_{t-1}^{1} F_{U}(k) dk + \int_{1}^{t} F_{U}(k) dk$$
(4.23)

$$= \int_{t-1}^{1} k dk + \int_{1}^{t} 1 dk \tag{4.24}$$

$$= \left\{\frac{k^2}{2}\right\}_{t-1}^1 + t - 1 \tag{4.25}$$

$$= \frac{1}{2} - \left(\frac{(t-1)^2}{2}\right) + t - 1 \tag{4.26}$$

$$=2t-\frac{t^2}{2}-1\tag{4.27}$$

Overall we can write the CDF of  $F_T(x)$  as,

$$F_T(x) = \begin{cases} 0 & , x < 0 \\ \frac{x^2}{2} & , 0 \le x \le 1 \\ 2t - \frac{t^2}{2} - 1 & , 1 \le x \le 2 \\ 1 & , x > 2 \end{cases}$$
 (4.28)

Now we will find PDF of T, As,

$$T = U1 + U2 (4.29)$$

We will use method of convolution to get PDF of T as U1 and U2 are i.i.d.

$$f_T(t) = \int_{-\infty}^{\infty} f_{U1}(x) f_{U2}(t-x) dx \quad (4.30)$$

Since U1, U2 are of same distribution we can write,

$$f_{U1}(x) = f_{U2}(x) = f_U(x)$$
 (4.31)  
 $\implies f_T(t) = \int_{-\infty}^{\infty} f_U(x) f_U(t-x) dx$  (4.32)

From the PDF of U,we can write

$$f_T(t) = \int_0^1 f_U(x) f_U(t-x) dx \qquad (4.33)$$
$$= \int_0^1 1.f_U(t-x) dx \qquad (4.34)$$

$$\int_{0}^{1} \int_{0}^{1} (t - x) dx \tag{4.34}$$

we will solve the above integral using sub-

stitution.

$$z = t - x \tag{4.36}$$

$$dz = -dx (4.37)$$

$$\implies f_T(t) = \int_t^{t-1} f_U(z) (-dz)$$
 (4.38)

$$= \int_{t-1}^{t} f_{U}(z) dz$$
 (4.39)

**Case -1** For t < 0 as z < t, the PDF  $f_U(z) = 0$ . So,

$$f_T(t) = 0 (4.40)$$

Case -2 For  $0 \le t \le 1$ , we will break the integral at z = 0, since  $f_U(z)$  changes at 0.

$$f_T(t) = \int_{t-1}^0 f_U(z) \, dz + \int_0^t f_U(z) \, dz \quad (4.41)$$

$$= 0 + \int_0^t 1dz \tag{4.42}$$

$$=t \tag{4.43}$$

Case-3 Similarly for  $1 \le t \le 2$ , we will break the integral at z = 1,

$$f_T(t) = \int_{t-1}^1 f_U(z) dz + \int_1^t f_U(z) \quad (4.44)$$

$$= \int_{t-1}^{1} 1.dz + 0 \tag{4.45}$$

$$=2-t\tag{4.46}$$

**Case-4** For t > 2,as z > t - 1 > 1,the PDF  $f_U(z) = 0$ . So,

$$f_T(z) = 0 (4.47)$$

Overall, the PDF of T will be,

$$f_T(x) = \begin{cases} 0 & , x < 0 \\ x & , 0 \le x \le 1 \\ 2 - x & , 1 \le x \le 2 \\ 0 & , x > 2 \end{cases}$$
 (4.48)

4.5 Verify your results through a plot.

**Solution:** This is already done in 4.1 ,4.2.

#### 5 Maximum Likelihood

- 5.1 Generate equiprobable  $X \in \{1, -1\}$ .
- 5.2 Generate

$$Y = AX + N, (5.1)$$

where A = 5 dB, and  $N \sim \mathcal{N}(0, 1)$ .

- 5.3 Plot Y using a scatter plot.
- 5.4 Guess how to estimate X from Y.
- 5.5 Find

$$P_{e|0} = \Pr(\hat{X} = -1|X = 1)$$
 (5.2)

and

$$P_{e|1} = \Pr(\hat{X} = 1|X = -1)$$
 (5.3)

- 5.6 Find  $P_e$  assuming that X has equiprobable symbols.
- 5.7 Verify by plotting the theoretical  $P_e$  with respect to A from 0 to 10 dB.
- 5.8 Now, consider a threshold  $\delta$  while estimating X from Y. Find the value of  $\delta$  that maximizes the theoretical  $P_e$ .
- 5.9 Repeat the above exercise when

$$p_X(0) = p \tag{5.4}$$

5.10 Repeat the above exercise using the MAP criterion.

#### 6 Gaussian to Other

6.1 Let  $X_1 \sim \mathcal{N}(0, 1)$  and  $X_2 \sim \mathcal{N}(0, 1)$ . Plot the CDF and PDF of

$$V = X_1^2 + X_2^2 \tag{6.1}$$

6.2 If

$$F_V(x) = \begin{cases} 1 - e^{-\alpha x} & x \ge 0\\ 0 & x < 0, \end{cases}$$
 (6.2)

find  $\alpha$ .

6.3 Plot the CDF and PDf of

$$A = \sqrt{V} \tag{6.3}$$

7 CONDITIONAL PROBABILITY

7.1 Plot

$$P_e = \Pr(\hat{X} = -1|X = 1)$$
 (7.1)

for

$$Y = AX + N, (7.2)$$

where A is Raleigh with  $E[A^2] = \gamma, N \sim \mathcal{N}(0,1), X \in (-1,1)$  for  $0 \le \gamma \le 10$  dB.

- 7.2 Assuming that N is a constant, find an expression for  $P_e$ . Call this  $P_e(N)$
- 7.3 For a function g,

$$E[g(X)] = \int_{-\infty}^{\infty} g(x)p_X(x) dx \qquad (7.3)$$

Find  $P_e = E[P_e(N)]$ .

7.4 Plot  $P_e$  in problems 7.7.2 and 7.7.2 on the same graph w.r.t  $\gamma$ . Comment.

8 Two Dimensions

Let

$$\mathbf{y} = A\mathbf{x} + \mathbf{n},\tag{8.1}$$

where

$$x \in (\mathbf{s}_0, \mathbf{s}_1), \mathbf{s}_0 = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \mathbf{s}_1 = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$
 (8.2)

$$\mathbf{n} = \begin{pmatrix} n_1 \\ n_2 \end{pmatrix}, n_1, n_2 \sim \mathcal{N}(0, 1). \tag{8.3}$$

8.1 Plot

$$\mathbf{y}|\mathbf{s}_0$$
 and  $\mathbf{y}|\mathbf{s}_1$  (8.4)

on the same graph using a scatter plot.

- 8.2 For the above problem, find a decision rule for detecting the symbols  $s_0$  and  $s_1$ .
- 8.3 Plot

$$P_e = \Pr\left(\hat{\mathbf{x}} = \mathbf{s}_1 | \mathbf{x} = \mathbf{s}_0\right) \tag{8.5}$$

with respect to the SNR from 0 to 10 dB.

8.4 Obtain an expression for  $P_e$ . Verify this by comparing the theory and simulation plots on the same graph.
